SEDIMENT SQUARE

Square Hole Series

Product Description

Sediment Square combines square perforation with manually applied pigment sedimentation to create a surface that balances geometric order and mineral character. A textile membrane is perforated with a regular grid of square openings and then treated with dispersed grey pigments that spread and settle organically across the fabric before lamination. The pigment introduces tonal variation and depth, while the square perforations allow controlled transmission of light and partial visibility through the surface. From a distance, the glass reads as dense and architectural, recalling stone or concrete. At closer range, the textile fibers, pigment accumulation, and perforation edges reveal a softer and more tactile structure. Sediment Square creates an architectural surface where structured geometry and organic pigment movement interact, producing a calm yet materially expressive glass element.

Material & Construction

- Laminated textile glass
- Textile layer: perforated textile manually dyed with dispersed grey pigments
- Chemical perforation with 3 × 3 mm square openings
- Organic pigment sedimentation preserved within the laminate
- Visible textile fibers and pigment variations embedded within the glass
- Double-sided visual depth through pigment and textile structure

Technical Information

- **Thickness options:** 8 / 10 / 12 / 16 mm
- **Maximum panel size:** up to 2000 × 3000 mm
- **Processing:** CNC cutting, edge polishing, custom formats
- **Safety:** laminated; tempered laminated on request

Applications

High-end concrete interiors · Space partitions · Feature walls · Architectural interiors

Customization

Pigment tone, perforation density, textile type, and panel dimensions can be adapted according to architectural project requirements.

Maintenance

Clean with standard glass cleaner and a soft cloth. Avoid abrasive materials.
